UNS, LLC OVERVIEW:

Universal Networking Services, LLC specializes in mission-critical power and cooling solutions for wiring closets, server rooms and data centers. As demand on technology increase, the design, installation and operation of IT infrastructure requires a professional and reliable service partner. UNS, LLC core competencies are product acquisition, data center design/build services, containerized data center solutions, installation, management and maintenance services.

We differentiate ourselves from our competitors by being a purpose-built solutions based provider that maximizes energy efficiency. We design solutions that are modular, scalable, manageable and reliable. Our design strategy incorporates the latest in power and cooling IT infrastructure.

A unique offering is our Critical Facility Energy Profile or CFEP. This service investigates the customers current configuration, identifies potential conflicts and makes recommendations on how to improve the overall reliability and energy efficiency of their IT facilities. CFEP recommendations are currently saving our clients thousands each month with no-cost solutions and saving them up to 20% on their electric bill.

UNS, LLC is also proud to partner with Datapod to deliver their award-winning modularized container data centers. With Datapod we can provide the data center community an alternative solution that maximizes their investment and increases the reliability and availability of their mission-critical facility.

The Datapod Containerized System utilizes APC InfraStruXure, including the high-density ready Hot Aisle Containment System. APC's Hot Aisle Containment System captures the hot air at its source, effectively making cooling a secondary issue, while enabling ultra-high densities across 1 or all of the IT equipment racks.   By combining the standardized pre-engineered Datapod building-blocks, featuring the modular, scalable APC InfraStruXure architecture, APC and Datapod offer the ultimate in on-demand data centers.

Our service and support are based on industry best practices. Instrumental to this process is providing the client with solutions that drive the total-cost of ownership (TCO) as low as possible. We are committed to understanding our clients challenges and provide the tools needed to operate their businesses with reliability and maximum efficiency.
